

THE PROJECT URL MAP

Teach Claude to Find Any of Your Projects by Name

> “Claude can't see your project list. Hand it the addresses and it can walk in.”

A free guide from Dan the Digital Man // dtdm.us

The Problem

You organize your work into Claude Projects. Then you type something like “pull up the Marketing project” and Claude has nothing to pull up. It cannot see a list of your Projects or their names.

That is by design. Claude walls each Project off from the others:

WHAT	HOW IT IS SCOPED
Past-chat search	Inside a Project, it searches only that Project's chats. Outside a Project, it skips Project chats.
Memory	Each Project keeps its own memory, separate from your other Projects and from your non-Project chats.
Instructions and files	They load only for the Project you are currently in.

So “by name” goes nowhere. There is no name-to-Project lookup on Claude's side. The one thing that does cross Project walls is a web address, as long as Claude can open it.

The Fix

Build the lookup yourself. Write a short list that pairs each Project name with its URL, and put it in the one place every Project inherits: your account-level profile preferences.

Now when you say a Project's name, Claude has an address to open, reads that Project's instructions and files, and answers with that context.

> **WHY PROFILE LEVEL**
>
> Profile preferences apply to all your conversations. Project instructions apply only inside their own Project. The map goes in profile preferences so it works from every Project and from chats outside Projects.

What You Need

A URL only helps if Claude can open it. Your Projects sit behind your login, so a plain public web fetch hits the sign-in wall.

REQUIREMENT	WHAT IT DOES
A browser connection	Claude in Chrome is an extension that lets Claude read, click, and navigate sites using your existing logins. That is what lets it open your Projects.
Your Project URLs	One address per Project, copied from your browser while the Project is open.
The template	The paste-ready block on the next page.

NO BROWSER CONNECTED?

With no browser connected, Claude cannot open the URL. The template tells it to say so in one line and ask you to paste what it needs, so you are never left guessing.

Setup in Four Steps

1

Collect the addresses

On claude.ai, open Projects in the left sidebar, click into a Project, and copy the full address from your browser's address bar. Repeat for each Project you want on the map.

2

Open your preferences

Click your initials in the lower-left corner, choose Settings, then Profile. Find the box asking what personal preferences Claude should consider in responses.

3

Paste the template

Paste the block from the next page. Swap every [PASTE URL HERE] for the matching address, and keep the names exactly as your Projects are titled.

4

Save and test

Save, then start a new chat. Preferences apply to new conversations, so an old chat will not see them.

The Template

Copy everything inside the box. Replace each **[PASTE URL HERE]** with a real address, and edit the names to match your own Projects.

```
PROJECT URL MAP

When I mention a project by name and its content is not in the
current conversation or the active project, open that project's
URL in the browser tool and read from it before answering. Treat
that project's instructions and file list as the source of truth
for it. If no browser tool is connected, say so in one line and
ask me to paste the content I need. Never guess a URL. If a name
is not on this list, ask me for its URL once.

Marketing: [PASTE URL HERE]
Development: [PASTE URL HERE]
Research: [PASTE URL HERE]
Brand & Voice: [PASTE URL HERE]
Brainstorming: [PASTE URL HERE]
```

What each line does

LINE	PURPOSE
Trigger	“When I mention a project by name and its content is not in the current conversation” keeps Claude from opening a browser when it already has the context.
Source of truth	Tells Claude to treat the opened Project's instructions and file list as authoritative for that Project.
Fallback	Covers the no-browser case so the failure is one line, not a stall.
Never guess	Stops Claude from inventing an address. A wrong guess wastes a turn and may land on the wrong page.
Ask once	A name not on the list gets a single question, not repeated prompting.

Keep It Working

RULE	WHY
Exact names	Use the same name you use out loud. Claude matches what you say to what is on the list.
Keep the list short	Preferences load with every message. List the Projects you actually jump between.
Refresh stale URLs	If you delete or rebuild a Project, update its line. A dead address sends Claude nowhere.
Pick the right level	Anything specific to one Project stays in that Project's instructions. Only the map lives in your profile.

SECURITY NOTE

Claude in Chrome acts inside your logged-in browser, so it can reach anything you can reach. Web pages can carry hidden instructions aimed at AI agents. Keep sensitive tabs closed while it works, and read what it asks to do.

Test It

Start a new chat outside any Project and try:

```
Pull up the Marketing project and tell me what its
instructions say.

In Development, what files do I have loaded?
```

If Claude opens the address and answers from that Project, the map works.

Pair It With Project Hopping

The map gets Claude into the right Project by name. Project Hopping, the companion guide, covers what to do once you are there: treating each Project as its own persona and walking one idea through several lenses. Shortcut phrase for the hop: **PCP** (“project changed, proceed”).
